1 General description

The TFA9897 is a high efficiency class-D audio amplifier with a sophisticated speaker-boost protection algorithm. It can deliver 1.2 W (RMS; THD = 1 %) output power into an 8 Ω speaker at a battery voltage of 3.6 V. The internal boost converter raises the supply voltage to 5.3 V, providing ample headroom for major improvements in sound quality.

A safe working environment is provided for the speaker under all operating conditions. The TFA9897 maximizes acoustic output while ensuring diaphragm displacement and voice coil temperature do not exceed their rated limits. This function is based on a speaker box model that operates in all loudspeaker environments (e.g. free air, closed box or vented box). Furthermore, advanced signal processing ensures that the audio signal is always of optimum quality.

The adaptive sound maximizer algorithm uses feedback to accurately calculate both the temperature and the excursion, allowing the TFA9897 to adapt to changes in the acoustic environment.

Internal intelligent DC-to-DC conversion boosts the supply rail to provide additional headroom and power output. The supply voltage is only raised when necessary. This feature maximizes the output power of the class-D audio amplifier while limiting quiescent power consumption.

The TFA9897 also incorporates advanced battery protection. By limiting the supply current when the battery voltage is low, it prevents the audio system drawing excessive load currents from the battery (excessive load currents could cause a system undervoltage). The advanced processor minimizes the impact of a falling battery voltage on the audio quality by preventing distortion as the battery discharges.

The device features low RF susceptibility because it has a digital input interface that is insensitive to clock jitter. The second order closed loop architecture used in a class-D audio amplifier provides excellent audio performance and high supply voltage ripple rejection. The audio input interface is TDM and can be I^2S configured. Control settings are communicated via an I^2C-bus interface.

The TFA9897 is available in a 30-bump WLCSP (Wafer Level Chip-Size Package) with a 400 µm pitch.

2 Features and benefits

- Sophisticated speaker-boost and protection algorithm that maximizes speaker performance while protecting the speaker:
  - Fully embedded software, no additional license fee or porting required
  - Total integrated solution that includes DSP, amplifier, DC-to-DC, sensing and more.
- Adaptive excursion control guarantees that the speaker membrane excursion never exceeds its rated limit
- Real-time temperature protection - direct measurement ensures that voice coil temperature never exceeds its rated limit
- Environmentally aware - automatically adapts speaker parameters to acoustic and thermal changes including compensation for speaker-box leakage
- Output power: 1.2 W (RMS) into 8 Ω at 3.6 V supply voltage (THD = 1 %)
- Low noise Receiver mode
- Clip avoidance - DSP algorithm prevents clipping even with sagging supply voltage
- Bandwidth extension option to increase low frequency response
- Intelligent DC-to-DC converter maximizes audio headroom from any supply level and limits current consumption at low battery voltages
- Compatible with standard Acoustic Echo Cancellers (AECs)
- High efficiency and low-power dissipation
- Wide supply voltage range (fully operational from 2.5 V to 5.5 V)
- TDM audio interface configurable from 2 slots (I2S) up to 16 slots
- I^2C-bus control interface (400 kHz)
- Dedicated speech mode with speech activity detector
- Speaker current and voltage monitoring (via the TDM-bus) for Acoustic Echo Cancellation (AEC) at the host
- Fully short-circuit proof across the load and to the supply lines
- Sample frequencies from 8 kHz up to 48 kHz supported
- Option to route TDM input direct to TDM output to allow a second TDM input slave device to be used in combination with the TFA9897
- Volume control
- Low RF susceptibility
- Input clock jitter insensitive interface
- Thermally protected
- Low ‘pop noise' at all mode transitions

 Copyright © 2020 Shenzhen Goodix Technology Co., Ltd.

3 Applications

- Mobile phones
- Tablets
- Portable gaming devices
- Portable Navigation Devices (PND)
- Notebooks/Netbooks
- MP3 players and portable media players

8 Functional description

The TFA9897 is a highly efficient mono Bridge Tied Load (BTL) class-D audio amplifier with a sophisticated speaker-boost protection algorithm. *Figure 6-1* is a block diagram of the TFA9897.

The device contains two TDM input/output channels. The number of slots and number of bits per slot can be configured for each TDM channel and the channel can be configured as input or output. Typically, one TDM channel is configured as a standard I^2S input while the other TDM channel is used for stereo sync, where gain information is transferred between the devices.

It is also possible to output current sense and voltage sense information on the TDM interface, which can be processed by the audio host.

The speaker-boost protection algorithm, running on a CoolFlux Digital Signal Processor (DSP) core, maximizes the acoustical output of the speaker while limiting membrane excursion and voice coil temperature to a safe level. The mechanical protection implemented guarantees that speaker membrane excursion never exceeds its rated limit, to an accuracy of 10 %. Thermal protection guarantees that the voice coil temperature never exceeds its rated limit, to an accuracy of ±10 °C. Furthermore, advanced signal processing ensures that the audio quality is always acceptable.

The protection algorithm implements an adaptive loudspeaker model that is used to predict the extent of membrane excursion. The model is continuously updated to ensure that the protection scheme remains effective even when speaker parameter values change or the acoustic enclosure is modified.

The speaker-boost protection algorithm boosts the output sound pressure level within given mechanical, thermal and quality limits. An optional Bandwidth extension mode extends the low frequency response up to a predefined limit before maximizing the output level. This mode is suitable for listening to high-quality music in quiet environments.

The frequency response of the TFA9897 can be modified via ten fully programmable cascaded second-order biquad filters. The first two biquads are processed with 48-bit double precision; biquads 3 to 8 are processed with 24-bit single precision.

At low battery voltage levels, the gain is automatically reduced to limit battery current.

The output volume can be controlled by the speaker-boost protection algorithm or by the host application (external). In the latter case, the boost features of the speaker-boost protection algorithm must be disabled to avoid neutralizing external volume control.

The speaker-boost protection algorithm output is converted into two pulse width modulated (PWM) signals which are then injected into the class-D audio amplifier. The 3-level PWM scheme supports filterless speaker drive.

The adaptive DC-to-DC converter boosts the battery supply voltage in line with the output of the speaker-boost protection algorithm. It switches to Follower mode ($V_{BST} = V_{BAT}$; no boost) when the audio output voltage is lower than the battery voltage.

8.1 Protection mechanisms

The following protection circuits are included in the TFA9897:

- OverTemperature Protection (OTP)
- OverVoltage Protection (OVP)
- UnderVoltage Protection (UVP)
- OverCurrent Protection (OCP)

Copyright © 2020 Shenzhen Goodix Technology Co., Ltd.

The reaction of the device to fault conditions differs depending on the protection circuit involved.

8.1.1 OverTemperature Protection (OTP)

OTP prevents heat damage to the TFA9897. It is triggered when the junction temperature exceeds $T_{act(th_prot)}$. When this happens, the output stages are set floating. OTP is cleared automatically via an internal timer (approximately 200 ms), after which the output stages start to operate normally again.

8.1.2 Supply voltage protection (UVP and OVP)

UVP is activated and the power stages are set floating if V_{BAT} drops below the undervoltage protection threshold, $V_{P(uvp)}$. When the supply voltage rises above $V_{P(uvp)}$ again, the system will be restarted after approximately 200 ms.

OVP is activated, setting the booster to Follower mode, if the power supply voltage (V_{DDP}) rises above the overvoltage protection threshold, $V_{P(ovp)}$. The power stages are re-enabled as soon as the supply voltage drops below $V_{P(ovp)}$ again. The system will be restarted after approximately 200 ms.

8.1.3 OverCurrent Protection (OCP)

OCP detects a short circuit across the load or between one of the amplifier outputs and one of the supply lines. If the output current exceeds the overcurrent protection threshold ($I_{O(ocp)}$), it is limited to $I_{O(ocp)}$ while the amplifier outputs are switching (the amplifier is not powered down completely). The amplifier can distinguish between an impedance drop at the loudspeaker and a low-ohmic short circuit across the load or to one of the supply lines. The impedance threshold depends on which supply voltage is being used.

14 Soldering of WLCSP packages

14.1 Introduction to soldering WLCSP packages

This text provides a very brief insight into a complex technology. More information about handling, packing, shipping and soldering of moisture/reflow sensitive surface-mount devices can be found in IPC/JEDEC J-STD-033 and IPC/JEDEC J-STD-020.

Wave soldering is not suitable for this package.

All Goodix WLCSP packages are lead-free.

14.2 Board mounting

Board mounting of a WLCSP requires several steps:

1. Solder paste printing on the PCB
2. Component placement with a pick and place machine
3. The reflow soldering itself

14.3 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see *Figure 14-1*) than a SnPb process, thus reducing the process window
- Solder paste printing issues, such as smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature), and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic) while being low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with *Table 14-1*.

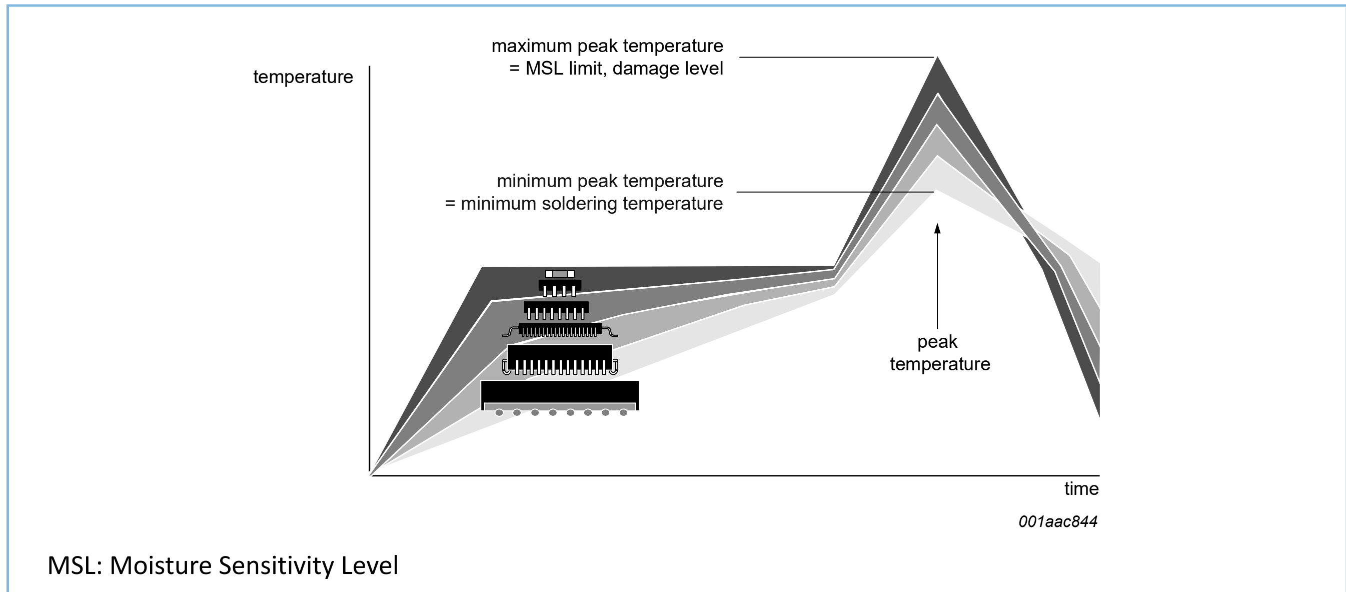
Table 14-1: Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm^3)		
	< 350	350 to 2 000	> 2 000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

 Copyright © 2020 Shenzhen Goodix Technology Co., Ltd.

Studies have shown that small packages reach higher temperatures during reflow soldering, see *Figure 14-1*.



MSL: Moisture Sensitivity Level

Figure 14-1: Temperature profiles for large and small components

For further information on temperature profiles, refer to IPC/JEDEC J-STD-033 and IPC/JEDEC J-STD-020.

14.3.1 Stand off

The stand off between the substrate and the chip is determined by:

- The amount of printed solder on the substrate
- The size of the solder land on the substrate
- The bump height on the chip

The higher the stand off, the better the stresses are released due to TEC (Thermal Expansion Coefficient) differences between substrate and chip.

14.3.2 Quality of solder joint

A flip-chip joint is considered to be a good joint when the entire solder land has been wetted by the solder from the bump. The surface of the joint should be smooth and the shape symmetrical. The soldered joints on a chip should be uniform. Voids in the bumps after reflow can occur during the reflow process in bumps with high ratio of bump diameter to bump height, i.e. low bumps with large diameter. No failures have been found to be related to these voids. Solder joint inspection after reflow can be done with X-ray to monitor defects such as bridging, open circuits and voids.

14.3.3 Rework

In general, rework is not recommended. By rework we mean the process of removing the chip from the substrate and replacing it with a new chip. If a chip is removed from the substrate, most solder balls of the chip will be damaged. In that case it is recommended not to re-use the chip again.

Copyright © 2020 Shenzhen Goodix Technology Co., Ltd.

Device removal can be done when the substrate is heated until it is certain that all solder joints are molten. The chip can then be carefully removed from the substrate without damaging the tracks and solder lands on the substrate. Removing the device must be done using plastic tweezers, because metal tweezers can damage the silicon. The surface of the substrate should be carefully cleaned and all solder and flux residues and/or underfill removed. When a new chip is placed on the substrate, use the flux process instead of solder on the solder lands. Apply flux on the bumps at the chip side as well as on the solder pads on the substrate. Place and align the new chip while viewing with a microscope. To reflow the solder, use the solder profile shown in IPC/JEDEC J-STD-033 and IPC/JEDEC J-STD-020.

14.3.4 Cleaning

Cleaning can be done after reflow soldering.

16 Revision history

Table 16-1: Revision history

Document ID	Release date	Data sheet status	Change notice	Supersedes
TFA9897_SDS v 3.0	20200121	Product short data sheet	-	TFA9897_SDS v.2
Modifications:	• Updated document format based on Goodix template			
TFA9897_SDS v.2	<tbd>	Product short data sheet	-	TFA9897_SDS v.1
Modifications:	• Specification status changed to 'Product short data sheet' • *Table 4-1*: value of parameter $P_{o(RMS)}$ (32 kHz) corrected • *Section 8.1.2*: text of 2nd paragraph revised • *Table 11-1*: measurement conditions revised in table header (L_L = 44 µH) and for pin SDA parameter V_{OH} • *Table 11-2*: values changed for parameters $t_{d(soft_mute)}$ and t_{PD} • *Figure 12-1* and *Figure 12-2* updated			
TFA9897_SDS v.1	20141127	Preliminary short data sheet	-	-
